## **DEDICATÓRIA**

Dedico essa dissertação à minha mãe, por ter sido meu maior incentivo a continuar na área acadêmica, sendo sempre um grande exemplo de dedicação e minha maior inspiração como pessoa.

## **AGRADECIMENTOS**

A Deus, por sempre me permitir trilhar os planos Dele, que continuam infinitamente maiores e melhores que os meus, me sustentando e capacitando em todos os momentos.

A minha família, por terem sido mais uma vez meu porto seguro e meu apoio e por sempre me incentivarem a seguir e viver os meus sonhos.

A meu marido, por não medir esforços para que mais uma etapa fosse realizada, me apoiando incondicionalmente em todos os momentos, e por ser uma grande inspiração de persistência e dedicação.

As minhas amadas orientadoras, profa Fabiana Naufel e profa Bianca Maran, por deixarem tudo mais leve e suave e me transmitirem tantas lições que levarei para sempre. Serão meus grandes exemplos de mestres.

A minha banca querida, profa Juliana Bombonatti e profa Eloisa Andrade, por compartilharem esse momento tão importante e especial e contribuírem para o meu crescimento.

A todos os mestres que passaram pela minha vida nessa etapa, minha gratidão pelo carinho e dedicação que tiveram, saibam que todo o aprendizado e convivência fizeram muita diferença na minha vida.

A minha amiga especial, Larissa Pozzobon, que levarei por toda a vida, agradeço por compartilhar comigo dos melhores e mais difíceis momentos ao longo dessa jornada, deixando-a mais alegre e bonita.

Aos meus colegas e à Unioeste, que me acolheu por dois anos, muito obrigada por tantas experiências, guardarei em um lugar muito especial do meu coração.

## Avaliação da qualidade de vida em pacientes submetidos a clareamento dental caseiro – revisão sistemática e metanálise

### RESUMO

**INTRODUÇÃO:** O clareamento dental caseiro proporciona benefícios estéticos aos pacientes e pode ajudar a melhorar sua autoestima e autoconfiança. É também um tratamento simples e eficaz com ótimos resultados a curto prazo. Embora possa apresentar alguns riscos, é considerado um método seguro e minimamente invasivo. **OBJETIVO:** Avaliar, por meio de revisão sistemática e metanálise, se os pacientes submetidos ao clareamento dental caseiro tiveram sua qualidade de vida melhorada. **MATERIAIS E MÉTODO:** Os estudos foram pesquisados nas seguintes bases de dados eletrônicas (até junho de 2021): MEDLINE (via PubMed), Biblioteca Cochrane, Biblioteca Odontológica Brasileira, Literatura Latino-Americana e do Caribe em Ciências da Saúde (LILACS) e bases de citações (Scopus, Web of Science e EMBASE). Os estudos foram selecionados de acordo com seus títulos, sem restrições de idioma. A qualidade do estudo foi avaliada com a ferramenta Cochrane Collaboration para detectar o risco de viés. **TRATAMENTO ESTATÍSTICO:** Os dados foram analisados com o software estatístico RStudio e resumidos calculando a diferença média padronizada para dados contínuos e razão de risco e, juntamente com o intervalo de confiança de 95%, para dados dicotômicos, usando um modelo de efeitos aleatórios expresso em tabelas e gráficos. **RESULTADOS:** Duplicatas foram removidas e dois revisores selecionaram os estudos que atendiam aos critérios de inclusão. Dos 68 artigos em texto completo avaliados, 13 permaneceram e foram analisados para resultados iniciais. Destes, um artigo teve alto risco de viés, um teve baixo risco e os outros 11 tiveram risco incerto. Dos 13 artigos avaliados, sete fizeram parte da metanálise e apresentaram 87% de satisfação do paciente após o clareamento. **CONCLUSÃO:** Houve melhora na qualidade de vida dos pacientes submetidos ao clareamento dental caseiro.

# Quality of life assessment in patients undergoing at-home tooth whitening – systematic review and meta-analysis

## ABSTRACT

**INTRODUCTION:** At-home tooth bleaching provides esthetic benefits to patients and can help to improve their self-esteem and self-confidence. It is also a simple and effective treatment with great short-term results. Although it may present some risks, it is considered a safe and minimally invasive method. **OBJECTIVE:** To assess, through a systematic review and meta-analysis, whether patients subjected to at-home tooth bleaching had their quality of life improved. **MATERIALS AND METHOD:** The studies were searched in the following electronic databases (until June 2021): MEDLINE (via PubMed), Cochrane Library, Brazilian Dental Library, Latin American and Caribbean Literature on Health Sciences (LILACS), and citation databases (Scopus, Web of Science and EMBASE). The studies were selected according to their titles, without language restrictions. Study quality was assessed with the Cochrane Collaboration tool to detect the risk of bias. **STATISTICAL TREATMENT:** The data was analyzed with the RStudio statistical software and summarized by calculating the standardized mean difference for continuous data and risk ratio and, along with the 95% confidence interval, for dichotomous data, using a random-effects model expressed in tables and graphs. **RESULTS:** Duplicates were removed and two reviewers selected the studies that met the inclusion criteria. Of the 68 full-text articles evaluated, 13 remained and were analyzed for initial results. Of these, one article had a high risk of bias, one had a low risk, and the other 11 had an uncertain risk. Of the 13 articles evaluated, seven were part of the meta-analysis and presented 87% of patient satisfaction after bleaching. **CONCLUSION:** There was an improvement in the quality of life of patients subjected to at-home tooth bleaching.

## **CAPÍTULO 1**

Quality of life assessment in patients undergoing at-home tooth whitening –  
systematic review and meta-analysis

## Introduction

Overall, the search for esthetics has been increasingly evidenced in society and this search is not different in dentistry, as esthetic treatments are frequently required by patients. Tooth bleaching, regardless of the form of application, consists of a conservative esthetic treatment because it improves smile appearance and preserves the tooth structure (NASCIMENTO et al., 2018).

In summary, there are two bleaching techniques: at-home and in-office. In-office bleaching is performed with high concentrations of hydrogen peroxide or carbamide peroxide gel (ALQAHTANI, 2014) and at-home bleaching is performed by the patients with the supervision of the dentist. In the latter technique, the main choices of bleaching gels are 10% to 22% carbamide peroxide and 3% to 10% hydrogen peroxide (ALQAHTANI, 2014) (MOKHLIS et al., 2000) (BIZHANG et al., 2009) (GHALILI et al., 2014) (ALONSO DE LA PENNA V. & LOPEZ RATON M., 2014).

Although tooth bleaching, regardless of the technique, may cause some adverse effects such as tooth sensitivity (REIS et al., 2011) (TAY et al., 2012) (He LB et al., 2012) (BONAFÉ et al., 2013), the assessment of the benefits of this procedure imply that the improvement in dental esthetics results in physical and self-esteem improvements (BARBIERE; RAPOPORT, 2009).

Job opportunities, personal relationships, and personality assessments are directly related to the pleasant appearance of teeth (BERSEZIO et al., 2018). However, when patients are dissatisfied with their appearance, they may show insecurity, low esteem, and anxiety, as well as physical and mental problems (NASCIMENTO et al., 2018).

Considering that clinical indicators cannot measure the social impacts on the lives of patients due to their subjectivity, quality of life assessment tools are used. An example is the Oral Health Impact Profile (OHIP), initially composed of 49 items and later simplified to 14, which focus on assessing functional limitations, physical pain, psychological discomfort, physical disability, psychological disability, social disability, and social disadvantage (ALVARENGA et al., 2011). There are also other widely used questionnaires: the PIDAQ, which assesses the psychosocial impacts of esthetics on the quality of life of patients, created by KLAGES et al. (2006), and composed of items including domains and subdomains such as self-confidence, social and psychological impacts, and esthetic concern; and the OES (Orofacial Esthetic Scale), which can be used with the same objective to assess the esthetic perception of patients and consists of eight

items involving esthetic aspects of the face, teeth, and gums, and one question for the overall assessment of the face and mouth (BONAFÉ, 2016). These questionnaires can be applied alone or combined.

Although some studies have assessed the impact of at-home tooth bleaching on the quality of life of patients, the literature does not present a systematic review aiming to find the true impact of this treatment on the lives of patients.

### **Objective**

Therefore, the present study aims to assess, with a systematic review and meta-analysis, whether patients subjected to at-home tooth bleaching had their quality of life improved.

## **Methodology**

### **Protocol and registration**

This systematic review was registered in the international prospective register of systematic reviews (PROSPERO) under number CRD42020220354 and followed the preferred reporting items for systematic review and meta-analysis protocols (PRISMA) recommendations (PAGE et al., 2021).

### **Information sources and search strategy**

The search strategy (Table 1) was initially defined for the MEDLINE via PubMed database, considering a controlled vocabulary (MeSH terms) and free keywords for each concept of the PICO question described at the end of the introduction. The outcomes assessed were the changes in the quality of life of patients subjected to at-home tooth bleaching, using specific questionnaires.

The MEDLINE search strategy was adapted to other electronic databases (Cochrane Library, Brazilian Dental Library, Latin American and Caribbean Literature on Health Sciences (LILACS)), and citation databases (Scopus, Embase, and Web of Science) Moreover, the gray literature (SIGLE) was investigated by searching the abstracts of the annual conference of the International Association for Dental Research (IADR) and its regional divisions (2001-2021), the System for Information on Grey Literature database in Europe, dissertations and theses using the ProQuest Dissertations and Theses full-text database, and the Capes Theses journal database. The ongoing studies were searched in the following clinical trial registers: Current Controlled Trials, International Clinical Trial Registry Platform, ClinicalTrials.gov, Rebec, and EU Clinical Trials Register.

Moreover, the lists of references of all primary and eligible studies of this systematic review were searched manually for additional relevant publications. The first two pages of study links related to each primary study in the PubMed database were also reviewed to search for eligible studies. In the entire search process, the studies were restricted based on publication date (June 7, 2021) and without language restrictions.

### **Selection criteria**

Randomized clinical trials assessing the quality of life of patients subjected to at-home tooth bleaching were included. Only parallel and split-mouth human clinical trials were included. The studies excluded were non-controlled clinical trials, editorial letters, case reports, and case series.

### **Selection of studies and data collection process**

The studies selected in the bibliographical search were reviewed in three phases. All studies were initially analyzed with the help of the Endnote X6 software for relevance by title, then by abstracts, and, finally, a full-text assessment. If there were doubts in any of these phases, the study was forwarded to the next phase. Three reviewers read the full texts to verify the inclusion criteria.

Each eligible study received an identification (ID), combining the first author and year of publication. Two reviewers (LP/ACCM) independently summarized and categorized the data as study design, the number of patients, interventions, and results. In the case of disagreements, the decision was made by consulting with a third reviewer. If there were several reports of the same study (i.e., reports with different follow-ups), the data of all reports were extracted directly to one single data collection form to prevent multiple entries.

The data collected regarded quality of life improvement after concluding the bleaching treatment, with periods from seven to 30 days after bleaching. This variation occurred due to the differences in the assessment periods reported in the primary studies. If the study reported several assessments, the data were collected around seven days after bleaching because it was the most reported period. If the study assessed color change at least 360 days after bleaching, it was collected to assess the long-term efficacy of the study groups.

### **Data extraction and conversion to the desired format**

The data on patient satisfaction were extracted according to the reports of the primary studies.

### **Risk of bias of individual studies**

Two independent reviewers assessed the quality of the trials selected with the Cochrane<sup>21</sup> collaboration tool to assess the risk of bias (version 1 of RoB) for randomized clinical trials. The assessment criteria had six items: selection bias (production of adequate sequence and allocation concealment), performance bias (patient and operator blinding), detection bias (evaluator blinding), attrition bias (incomplete result data), report bias (selective result data), and other biases. Any other type of bias in the last item of this systematic review was not included. The disagreements between the reviewers were solved with a discussion and, if necessary, by consulting with a third reviewer (B.M.M.).

Each item was classified as a low, high, or uncertain risk of bias. The study had a low risk of bias if all five items of the risk of bias tool had a low risk of bias. If one or more items were considered an uncertain risk, the study was considered an uncertain risk. If at least one item presented a high risk of bias, the study was considered a high risk of bias.

Figure 1. Summary of the assessment of the risk of bias according to the Cochrane collaboration tool.

## Summarized measures and synthesis of results

The data were analyzed with the RStudio statistical software (Version 1.3.959 TM 2009-2020 RStudio, PBC). The meta-analysis was performed with all the eligible studies using the random-effects model and studies assessing the quality of life of patients after at-home bleaching.

## Results

### Selection of studies

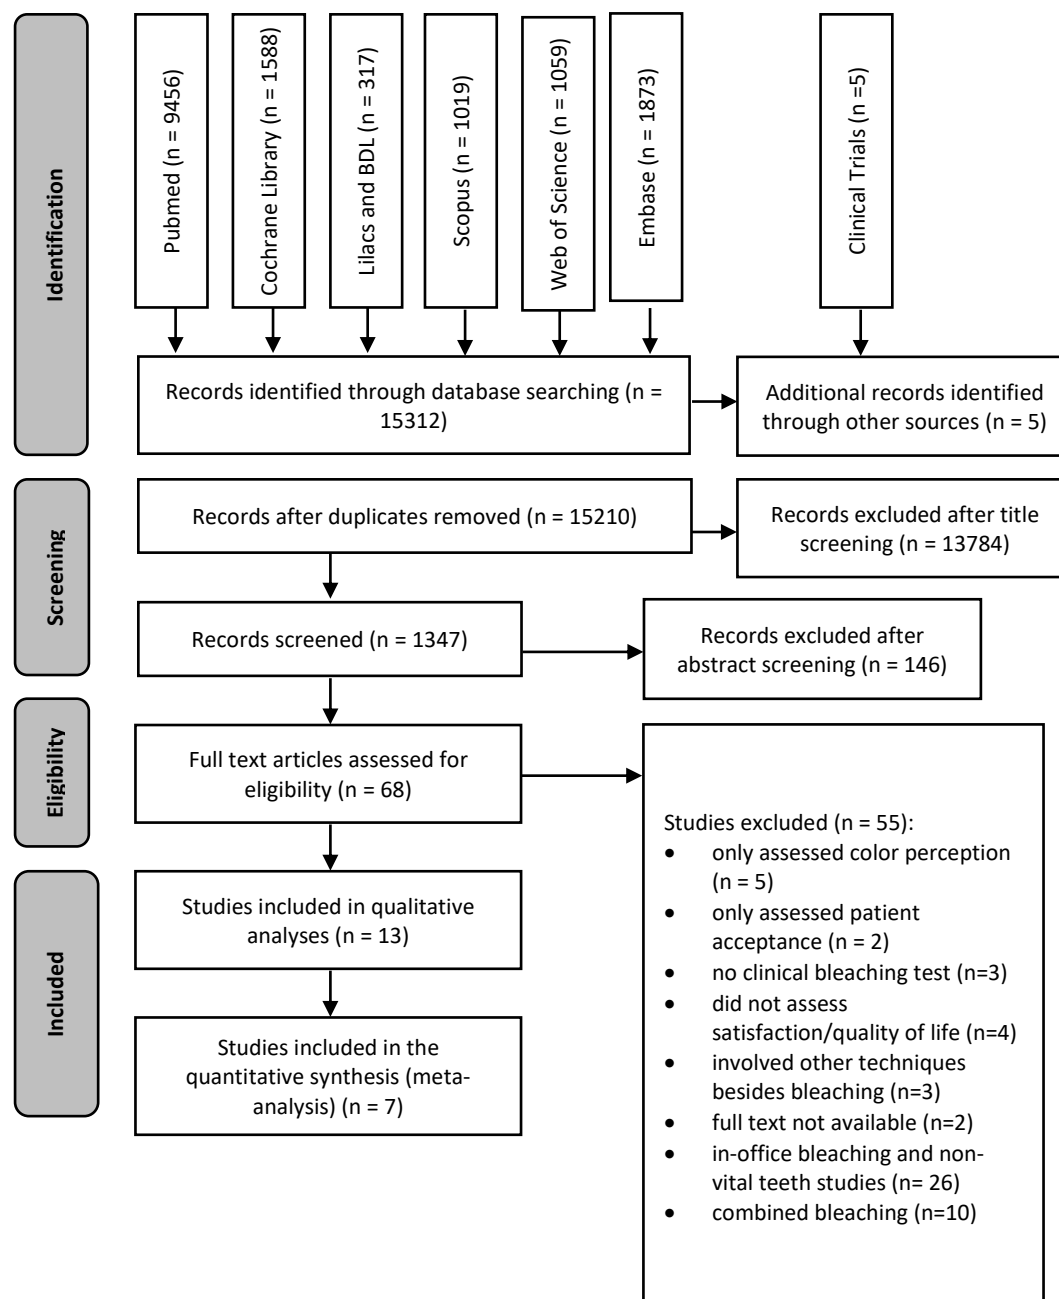

The search strategy was performed on April 14, 2021. After screening the databases and removing duplicates, 15,312 studies were identified. After the screening of duplicates, titles, and abstracts, 68 studies remained. The full texts of these 68 studies

were assessed and 66 randomized clinical trials were excluded for the following reasons: 26 studies assessed in-office bleaching and/or non-vital tooth bleaching, 10 assessed combined bleaching, 11 did not assess patient satisfaction, three were not clinical studies, two did not have full texts available, and three involved other bleaching techniques (Figure 2).

### Characteristics of the studies included

Chart 1 lists the characteristics of the 13 eligible studies. Twelve studies were parallel, and only one was a split-mouth study. The age of patients ranged from 18 to 50 years (Chart 1).

Figure 2. Flowchart of study identification.

Chart 2 - Assessment methods.

## Bleaching protocols

The bleaching gels used for at-home bleaching were CP and HP. Nine studies<sup>15,23,27,28,24,21,17,18,20</sup> used CP in concentrations between 10% and 17% and the daily use time varied between 15 minutes and eight hours. Four studies<sup>16,27,19,22</sup> used HP, which presented a concentration between 3% and 10%, with daily gel use between 10 and 60 minutes at an interval from seven to 21 days.

## Meta-analysis

Figure 3. Meta-analysis result.

Of all the eligible studies, six could not enter the meta-analysis due to the lack of data reporting, and the seven studies included reported patient satisfaction with dichotomous data, assessing the relationship of at-home tooth bleaching and quality of life.

The improvement evidence in this interaction was 87.0% (95% CI: 31.0-100.0;  $I^2 = 94.0\%$ ). The lowest evidence found was 43.0% in the study by Teixeira (2013), while the highest was 100% in the studies by Leonard (2003) and Bernardon (2016) (Figure 3).

## Discussion

The results obtained in the meta-analysis indicate that 87% of patients presented quality of life improvements after at-home tooth bleaching, which confirms the existence of a strong relationship of self-esteem and self-perception with dental esthetic improvement.

At-home bleaching has been a great ally in dental esthetics for some time and, although it involves certain costs, risks, and disadvantages (RAO, et al., 2009) (ANAGNOUSTOU, et al., 2010) (BERGER, et al., 2008), one of the greatest reasons of the popularity of this treatment is the conceived idea that oral health is intimately related

to the white color of teeth, as well as the current accessibility to such a procedure (TEIXEIRA, 2013).

As for the high patient satisfaction level of this study, the present meta-analysis corroborates other studies that show good efficacy of at-home bleaching on the tooth color of the volunteers (CARLOS et al., 2017) (MATIS et al., 2002) (GOMES et al., 2009), highlighting this potential relationship between tooth color improvement and patient satisfaction.

Considering that the face is the most notorious third, it becomes the prevalent physical characteristic related to the development of self-esteem, promoting better social interactions, self-confidence, and improved relationships (BOS A., HOOGSTRATEN J., PRAHL-ANDERSEN B., 2003). Even small differences in dental esthetics may have a significant effect on the quality of life (KLAGES U., BRUCKNER A., ZENTNER A., 2004), affecting the psychological and emotional state of individuals (KHAN M., FIDA M., 2008). Therefore, individuals satisfied with their physical appearance tend to be more extroverted and accomplished in social interactions (KLAGES U. et al., 2006).

Moreover, the current concept of health and disease may be considered biopsychosocial, implying that diseases have a multifactorial nature focusing on psychological issues in this process (MONCADA L. et al., 2009). Thus, explanations, causes, and even the possibility of a cure would involve biological and psychosocial aspects, promoting each person to a unit and their participation in the recovery process (MONCADA L. et al., 2009), creating the concept of health-related quality of life (NÚÑEZ L. et al., 2013).

However, several studies assessing the bleaching effect on teeth also analyzed sensitivity and the involvement of patients with the treatment (GEUS et al., 2018) (MEIRELES et al., 2014), considering that it is performed at home by the patient. Hence, high sensitivity indices may reduce satisfaction or even cause treatment withdrawal. Therefore, several questions should be considered regarding the low patient satisfaction rates.

Randomized clinical trials were selected as an inclusion criterion because when well executed and designed, they present a high quality of scientific evidence and are considered the gold standard for the efficacy of interventions (MILLS et al., 2009). Moreover, parallel studies, which represent more than 90% of the studies selected in this

systematic review, are considered the gold standard of clinical trials because they are not susceptible to the effects of previous treatments (CLEOPHAS & VOGEL, 1998).

There were nine different assessment questionnaires used in the studies, with specific ones such as the OHIP and Rosenberg self-esteem scale and broader ones such as forms and spontaneous response. Thus, the result should be analyzed with caution due to the lack of standardization and, consequently, the difficulty of grouping the studies for a more precise assessment.

Additionally, it is worth noting the need for further studies grouping the same assessment questionnaires to reinforce the evidence that at-home tooth bleaching improves the quality of life of patients.

## **Conclusion**

This systematic review with meta-analysis allows concluding that there is an improvement in the quality of life of patients subjected to at-home tooth bleaching. However, further studies are required to group the same questionnaires used for assessment.

## APPENDIX

### PROJECT REGISTRATION IN THE INTERNATIONAL PROSPECTIVE REGISTER OF SYSTEMATIC REVIEWS (PROSPERO).

#### PROSPERO International prospective register of systematic reviews

preferred format includes details of both inclusion and exclusion criteria.

**At home tooth bleaching.**

#### 21. \* Comparator(s)/control.

Where relevant, give details of the alternatives against which the intervention/exposure will be compared (e.g. another intervention or a non-exposed control group). The preferred format includes details of both inclusion and exclusion criteria.

**At home tooth bleaching.**

#### 22. \* Types of study to be included.

Give details of the study designs (e.g. RCT) that are eligible for inclusion in the review. The preferred format includes both inclusion and exclusion criteria. If there are no restrictions on the types of study, this should be stated.

**Inclusion criteria: randomized controlled trials that evaluated the quality of life of patients submitted to dental bleaching. We will include only parallel, split-mouth clinical trials in humans.**

**Exclusion criteria: non-controlled clinical trials, editorial letters, case reports and case series will be excluded.**

#### 23. Context.

Give summary details of the setting or other relevant characteristics, which help define the inclusion or exclusion criteria.

**Inclusion criteria: patients with discolored teeth.**

**Exclusion criteria: patients not eligible for cosmetic treatments due to the presence of other important pathological conditions such as dental caries, need for endodontics, orthodontics and periodontal treatment.**

#### 24. \* Main outcome(s).

Give the pre-specified main (most important) outcomes of the review, including details of how the outcome is defined and measured and when these measurements are made, if these are part of the review inclusion criteria.

**Quality of life assessment (assessed with different questionnaires, e.g. OHIP- 14, PIDAC, OES, among others, as noted in the studies).**

#### \* Measures of effect

Please specify the effect measure(s) for you main outcome(s) e.g. relative risks, odds ratios, risk difference, and/or 'number needed to treat.

**The effects will be evaluated after the end of treatment (mean difference or standardized mean difference or risk ratio).**

#### 25. \* Additional outcome(s).

List the pre-specified additional outcomes of the review, with a similar level of detail to that required for main outcomes. Where there are no additional outcomes please state 'None' or 'Not applicable' as appropriate to the review

**PROSPERO**  
International prospective register of systematic reviews

No restrictions will be placed on the publication date or languages, and all relevant studies will be translated and reviewed. We will search the abstracts of the annual conference of the International Association for Dental Research (IADR) and their regional divisions (2001-2019).

We are also going to explore the grey literature using the database System for Information on Grey literature in Europe (SIGLE), and dissertations and theses using the ProQuest Dissertations and Theses Fulltext database, and Periódicos Capes Theses database as well.

To locate unpublished and ongoing trials related to the review question, we will search the following clinical trials registries: Current Controlled Trials ([www.controlledtrials.com](http://www.controlledtrials.com)), International Clinical trials registry plataforma (<http://apps.who.int/trialsearch/>), The ClinicalTrials.gov ([www.ClinicalTrials.gov](http://www.ClinicalTrials.gov)), Rebec ([www.rebec.gov.br](http://www.rebec.gov.br)), EU Clinical Trials Register (<https://www.clinicaltrialsregister.eu>).

The search strategy will be appropriately modified for each database and executed by two reviewers to identify eligible studies. The full text versions of the papers that appear to meet the inclusion criteria will be retrieved for further assessment and data extraction.

**17. URL to search strategy.**

Upload a file with your search strategy, or an example of a search strategy for a specific database, (including the keywords) in pdf or word format. In doing so you are consenting to the file being made publicly accessible. Or provide a URL or link to the strategy. Do NOT provide links to your search results.

Alternatively, upload your search strategy to CRD in pdf format. Please note that by doing so you are consenting to the file being made publicly accessible.

**Do not make this file publicly available until the review is complete**

**18. \* Condition or domain being studied.**

Give a short description of the disease, condition or healthcare domain being studied in your systematic review.

**Improve in quality of life.**

**19. \* Participants/population.**

Specify the participants or populations being studied in the review. The preferred format includes details of both inclusion and exclusion criteria.

**Inclusion criteria: Patients with permanent dentition with discolored teeth.**

**Exclusion criteria: patients not eligible for cosmetic treatments due to the presence of other important pathological conditions such as dental caries, need for endodontics, orthodontics and periodontal treatment.**

**20. \* Intervention(s), exposure(s).**

Give full and clear descriptions or definitions of the interventions or the exposures to be reviewed. The

**PROSPERO**  
International prospective register of systematic reviews

**11. \* Review team members and their organisational affiliations.**

Give the personal details and the organisational affiliations of each member of the review team. Affiliation refers to groups or organisations to which review team members belong. **NOTE: email and country now MUST be entered for each person, unless you are amending a published record.**

Mrs ANNA ROMBALDO. UNIOESTE  
Dr Fabiana Scarparo Naufel. UNIVERSIDADE ESTADUAL DO OESTE DO PARANÁ  
Dr Bianca Medeiros Maranhão. UNIVERSIDADE ESTADUAL DO OESTE DO PARANÁ  
Maria Daniela Basso de Souza. UNIVERSIDADE ESTADUAL DO OESTE DO PARANÁ

**12. \* Funding sources/sponsors.**

Details of the individuals, organizations, groups, companies or other legal entities who have funded or sponsored the review.

None

**Grant number(s)**

State the funder, grant or award number and the date of award

None

**13. \* Conflicts of interest.**

List actual or perceived conflicts of interest (financial or academic).

None

**14. Collaborators.**

Give the name and affiliation of any individuals or organisations who are working on the review but who are not listed as review team members. **NOTE: email and country must be completed for each person, unless you are amending a published record.**

**15. \* Review question.**

State the review question(s) clearly and precisely. It may be appropriate to break very broad questions down into a series of related more specific questions. Questions may be framed or refined using P(I)E(C)OS or similar where relevant.

**Does at-home dental bleaching really improve the quality of life of patients with tooth discoloration?**

**16. \* Searches.**

State the sources that will be searched (e.g. Medline). Give the search dates, and any restrictions (e.g. language or publication date). Do NOT enter the full search strategy (it may be provided as a link or attachment below.)

To identify trial investigations that must be included for this review, we shall search on the electronic databases MEDLINE via PubMed, Scopus, Web of Science, Latin American and Caribbean Health Sciences Literature database (LILACS), Brazilian Library in Dentistry (BBO) and Cochrane Library.

We will also hand-search the reference lists of all primary studies for additional relevant publications and the related articles link of each primary study in the PubMed database without restrictions to publication date or languages.

**PROSPERO**  
International prospective register of systematic reviews

Review stage	Started	Completed
Preliminary searches	Yes	No
Piloting of the study selection process	No	No
Formal screening of search results against eligibility criteria	No	No
Data extraction	No	No
Risk of bias (quality) assessment	No	No
Data analysis	No	No

Provide any other relevant information about the stage of the review here.

**6. \* Named contact.**

The named contact is the guarantor for the accuracy of the information in the register record. This may be any member of the review team.

ANNA CAROLINA CENCI MATICK ROMBALDO

Email salutation (e.g. "Dr Smith" or "Joanne") for correspondence:

Mrs.ROMBALDO

**7. \* Named contact email.**

Give the electronic email address of the named contact.

annamatick@gmail.com

**8. Named contact address**

Give the full institutional/organisational postal address for the named contact.

RUA NATAL 2591, APTO 402, CEP 85807-100

**9. Named contact phone number.**

Give the telephone number for the named contact, including international dialling code.

(44) 99905-9955

**10. \* Organisational affiliation of the review.**

Full title of the organisational affiliations for this review and website address if available. This field may be completed as 'None' if the review is not affiliated to any organisation.

UNIVERSIDADE ESTADUAL DO OESTE DO PARANÁ

## Systematic review

*Fields that have an asterisk (\*) next to them means that they must be answered. Word limits are provided for each section. You will be unable to submit the form if the word limits are exceeded for any section. Registrant means the person filling out the form.*

### 1. \* Review title.

Give the title of the review in English

Patients with dental discoloration submitted to at-home dental bleaching can you improve the quality of life?

### 2. Original language title.

For reviews in languages other than English, give the title in the original language. This will be displayed with the English language title.

Pacientes com descoloração dental submetidos ao clareamento dental caseiro podem ter melhora na qualidade de vida?

### 3. \* Anticipated or actual start date.

Give the date the systematic review started or is expected to start.

28/09/2020

### 4. \* Anticipated completion date.

Give the date by which the review is expected to be completed.

31/08/2021

### 5. \* Stage of review at time of this submission.

Tick the boxes to show which review tasks have been started and which have been completed. Update this field each time any amendments are made to a published record.

**Reviews that have started data extraction (at the time of initial submission) are not eligible for inclusion in PROSPERO.** If there is later evidence that incorrect status and/or completion date has been supplied, the published PROSPERO record will be marked as retracted.

This field uses answers to initial screening questions. It cannot be edited until after registration.

The review has not yet started: No

National Institute for  
Health Research

Please provide anticipated publication date

Review\_Ongoing

**39. Any additional information.**

Provide any other information relevant to the registration of this review.

**40. Details of final report/publication(s) or preprints if available.**

Leave empty until publication details are available OR you have a link to a preprint. List authors, title and journal details preferably in Vancouver format.

Give the link to the published review or preprint.

**PROSPERO**  
**International prospective register of systematic reviews**

Select each language individually to add it to the list below, use the bin icon to remove any added in error.

English

There is an English language summary.

**32. \* Country.**

Select the country in which the review is being carried out. For multi-national collaborations select all the countries involved.

Brazil

**33. Other registration details.**

Name any other organisation where the systematic review title or protocol is registered (e.g. Campbell, or The Joanna Briggs Institute) together with any unique identification number assigned by them. If extracted data will be stored and made available through a repository such as the Systematic Review Data Repository (SRDR), details and a link should be included here. If none, leave blank.

**34. Reference and/or URL for published protocol.**

If the protocol for this review is published provide details (authors, title and journal details, preferably in Vancouver format)

Add web link to the published protocol.

Or, upload your published protocol here in pdf format. Note that the upload will be publicly accessible.

**No I do not make this file publicly available until the review is complete**

Please note that the information required in the PROSPERO registration form must be completed in full even if access to a protocol is given.

**35. Dissemination plans.**

Do you intend to publish the review on completion?

Yes

Give brief details of plans for communicating review findings.?

**36. Keywords.**

Give words or phrases that best describe the review. Separate keywords with a semicolon or new line. Keywords help PROSPERO users find your review (keywords do not appear in the public record but are included in searches). Be as specific and precise as possible. Avoid acronyms and abbreviations unless these are in wide use.

Quality of life, Tooth bleaching, Tooth discoloration

**37. Details of any existing review of the same topic by the same authors.**

If you are registering an update of an existing review give details of the earlier versions and include a full bibliographic reference, if available.

**38. \* Current review status.**

Update review status when the review is completed and when it is published. New registrations must be ongoing.

**\* Measures of effect**

Please specify the effect measure(s) for you additional outcome(s) e.g. relative risks, odds ratios, risk difference, and/or 'number needed to treat.

None

**26. \* Data extraction (selection and coding).**

Describe how studies will be selected for inclusion. State what data will be extracted or obtained. State how this will be done and recorded.

Articles will be selected by title and abstracts according to the previously described search strategy.

Duplicated articles published in more than one database will be considered only once. Full-text articles will also be obtained when the title and abstract have sufficient information to make a clear decision.

Subsequently, two reviewers will classify those which met the inclusion criteria. To handle with such a large number of studies, we will use a study ID for each eligible study, combining first author and year of publication. Any disagreements between the reviewers over the eligibility of particular studies will be resolved through discussion with a third reviewer.

**27. \* Risk of bias (quality) assessment.**

State which characteristics of the studies will be assessed and/or any formal risk of bias/quality assessment tools that will be used.

The assessment criteria six items: selection bias (adequate sequence generation and allocation concealment), performance bias (patient and operator blinding), detection bias (evaluator blinding), attrition bias (incomplete outcome data), reporting bias (selective outcome reporting), and other bias. Any other type of bias or limitation in the review will be addressed through discussion and if needed, by consulting a fourth reviewer.

Each domain level will judged as having low, high, or unclear risk of bias. At the study level, the study will at low risk of bias if all five domains of the risk of bias tool will at low risk of bias. If one or more domains will judged to have an unclear risk, the study will judged as an unclear risk; if at least one item will at high risk of bias, the study will considered to have a high risk of bias.

**28. \* Strategy for data synthesis.**

Describe the methods you plan to use to synthesise data. This must not be generic text but should be specific to your review and describe how the proposed approach will be applied to your data. If meta-analysis is planned, describe the models to be used, methods to explore statistical heterogeneity, and software package to be used.

Data will analyzed using the software RStudio statistical program (Version 1.3.1093 2009-2020 RStudio, PBC). Meta-analyses were performed in all eligible studies

**29. \* Analysis of subgroups or subsets.**

State any planned investigation of 'subgroups'. Be clear and specific about which type of study or
